

Interac Online/Debit Card Setup Instructions

This document contains the instructions to help merchants and their developers setup Interac Online processing within their account's HTML Capture Settings. The Interac Online service is only available via the HTML API since the customer's browser must be transferred to their card issuing bank.

To perform Interac Online transactions, do the following:

1. For Interac Online transactions, change the PaymentType value in your code to "DB". Credit Card transactions will continue to use "CC" as their PaymentType.
2. Login to <https://secure.psigate.com> and click on your StoreID.
3. Select "HTML Capture Settings" from the Store Menu.
4. The HTML Capture Settings Panel below shall be displayed.
5. The "Enable HTML Messenger" dropdown menu (labelled A below) must be set to "Yes".
6. The "Restrict Referring URLs" dropdown menu (labelled H below) must be set to "Yes".
7. The "Allowed Referring URLs" field (labelled I below) must include the valid URL(s), in the proper format, that are to send the Interac online or Credit Card request to PSiGate. Multiple URLs are separated by the pipe character "|".
8. The "Restrict Passed URLs" dropdown menu (labelled L below) must be set to "Yes".
9. The "Allowed Passed URLs" field (labelled M below) must include the valid URL(s), in the proper format, that are to receive an approved Interac Online or Credit Card response. Multiple URLs are separated by the pipe character "|".
10. The "Allowed Declined URLs" field (labelled N below) must include the valid URL(s), in the proper format, that are to receive a declined Interac Online or Credit Card response.
11. Click the "Save" button to save the above changes.
12. Send a test Interac Online request via the Real-time HTML API. The Interac Online Payment Details page should display.
13. If you have not yet done so, prepare a logo to display within the Interac Online Payment Details page.
